Field of the Invention The present invention relates to a fastener-driving tool, and particularly to a fastener-driving tool which has a motor in a bit head and can be operated forward and backward, to insert a bit into a fastener embedded in an object and pierce the fastener with the bit head. 2. Background of the Related Art Conventionally, fastener-driving tools are widely used for driving various types of fasteners for attaching one item of equipment to another item of equipment, or for fixing a workpiece to a workpiece. Among such fastener-driving tools, there is one having a motor in a head, and a bit provided with a slotted head at the front end thereof. In operation, the motor is rotated, and the rotation of the motor drives the bit. In this type of the fastener-driving tool, generally, the rotation of the motor drives the bit only forward, to pierce the fastener embedded in an object, and not backward, so that the head will not be driven into the object. In the conventional fastener-driving tool, a magnetic circuit is provided in the handle, so that the rotation of the motor is transferred to the bit by the magnetic circuit. Accordingly, when driving the fastener, an operator can move the tool through the handle by rotating the handle to drive the motor by an outer rotation of the handle. After the operator has finished driving the fastener, the operator stops the rotation of the handle, and sets the handle in a neutral position. However, the driving of the fastener by the fastener-driving tool causes a relatively large amount of torque to be applied to the drive-shaft. When the drive-shaft is stopped, and when the power is turned off, a large torque is applied to the drive-shaft even though the drive-shaft is stopped. Accordingly, there is a possibility that the drive-shaft will be damaged. In particular, the larger the drive-shaft, the more serious the problem becomes. Furthermore, f678ea9f9e
